Visualisation for the marine industry

Marine Tech Art specialise in both technical and artistic visualisation solutions for ship yards, yacht designers, interior designers, shipping companies, yacht brokers and maritime organisations.

Working with designers and builders we help visualise initial design concepts using both traditional methods and modern computer generated imagery (CGI). Later in the project lifecycle, we also work with the naval architects and shipyards to handle original construction data (CAD data) and optimise this for various uses from high end rendering and animation to detailed technical documentation and e-learning tools.

With the ever increasing need to reduce costs and speed up the time to market, the optimisation of the source CAD data from architect and shipyard ensures the accurate presentation of the craft and it's systems. This means that the technical documentation and training solutions can be delivered during the construction process, and the same data can be used for marketing purposes before the boat touches the water.
